there were no Andamanese there,
but 400 people consisting of 133 males and 130 females who migrated from Bassein in 1924. They were Karen Christians who had settled there. After returning to Long Island on the 12th, Mr Sarkar and party left in the motor boat "Return" for a short cruise along the Jarawa country. Besides Mr Joseph, there were Mr Pooviah and a few of his Burman Bush Police armed with rifles and guns. The party passed through the Homfray's Strait and anchored at the north eastern corner of the Spike Island. Loka and his party of three Andamanese accompanied them in their two canoes. They came to the shore in one of the Andamanese canoes and after entering the forest they found bundles of bamboos piled up at one corner. This was identified as a Jarawa raft. There were also three paddles made out of a palm tree. These specimens were procured for the Department. After proceeding some distance in the jungle, 19 small fire places were counted in scattered manner. A temporary hut was also noticed at a short distance. A number of objects usually used by the Andamanese tribes for household purposes was found including a sling for carrying babies. A beautiful specimen of a Jarawa Bow painted in red in geometrical designs was also found. Photographs were taken of the settlements of the Jarawa camp and objects collected for the Museum. In another place at *Yeratiajig* remnants of a Jarawa camp including pottery and bones of animals, etc., were found. The party returned to Long Island on 14-3-48 and examined 8 of the remaining members of Loka's party. It left the same day for Port Blair where it arrived at 10 P.M. On the 25th Mr Sarkar and his party with the Deputy Chief Commissioner Mr Gupta, left for Kar Nicobar where it arrived on the following day. It returned to Port Blair after staying for a few days. During this time in Kar Nicobar, besides studying the Nicobarese of the Island Mr Sarkar met two Jarawa children who were captured and brought over there and placed in a local Mission School for education.

In the following year in January 1949, another small party was sent under Dr A. K. Mitra with Messrs H. K. Bose and A. Bhattacharyya, to continue the survey of the Little Andaman further along the eastern coast. They visited *Hut Bay* on the 28th and went to the Onge settlement there. A large circular hut similar to that seen by us at Tambebui was observed. It contained nine cots with a fire place in the centre. There were also two outrigger canoes, one in front of the hut and another on the beach. Altogether 11 Onges were found consisting of 2 adult males, 6 females and 3 young children between the ages of 6 to 15. The 8 adults and the adolescent boys were carefully measured and observations noted about their special somatic characters. After leaving Hut Bay they went as far as the South Point which is the southernmost point on the eastern coast of the Little Andaman, but did not see any other Onge settlement. They had to return on the 31st as the launch could not be spared any further.

The Onges were found to be strong and healthy and free from venereal disease, a scourge, which along with tuberculosis were chiefly responsible for the rapid depopulation of the Andamanese tribes. Our observations agree with the accounts of the Negritos of the Andaman Islands published before
